Recap of
Progressive Web Applications

Web Applications

Easy access (URL)

References (External links)

Searchable (SEO)

Composeable (embedded via iframe)

Good [Web APIs](#)

Progressive Web Applications

Can install the application

Work offline / Background Sync

Notify the user (Push notifications)

Building blocks of a PWA

Web App Manifest

<https://w3c.github.io/manifest/>

Service Worker API

<https://w3c.github.io/ServiceWorker/>

HTTPS, HTTP/2 😍

Progressive enhancement approach

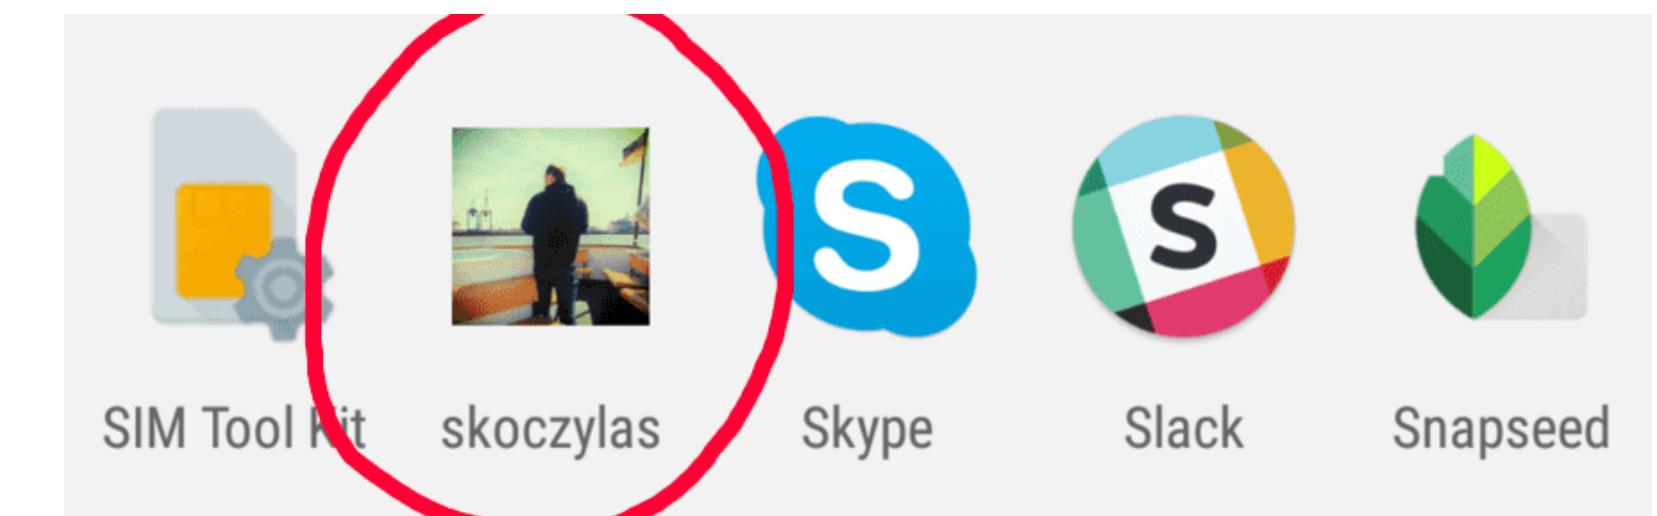

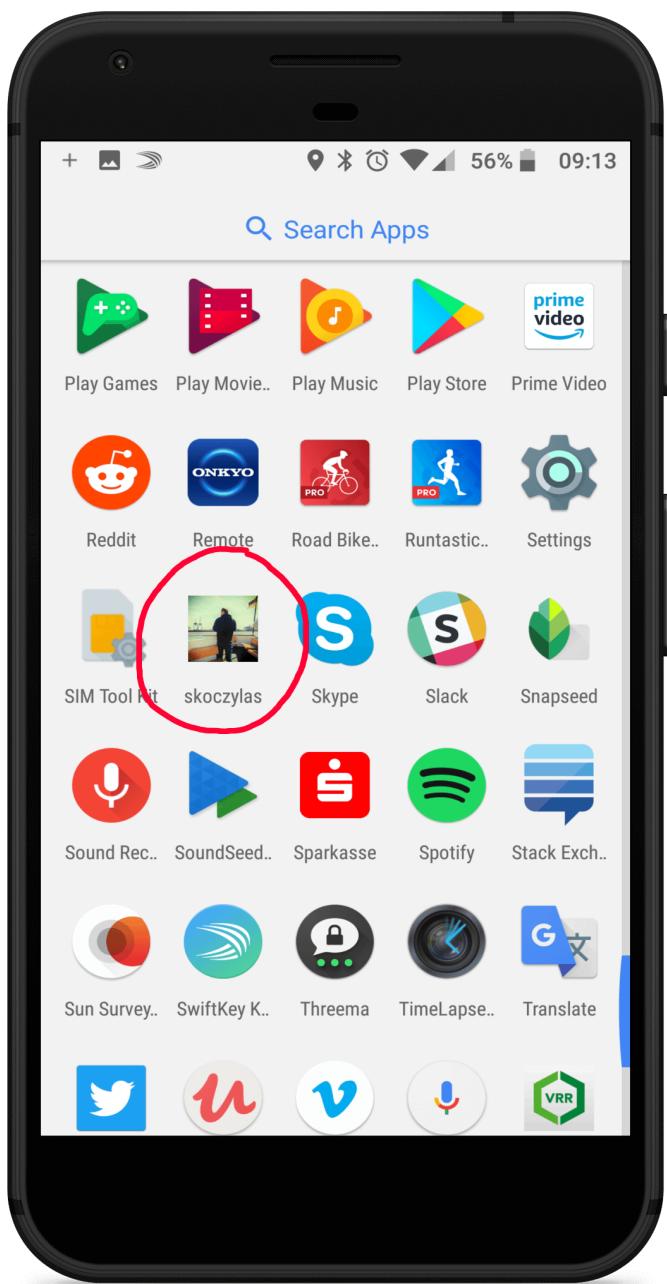

Progressive enhancement approach Feature detection

```
if ('foo' in window) {  
    // Cool! Use new feature! 😎  
} else {  
    // D'oh! Legacy approach is required. 😞  
}
```

Because some features will probably never be implemented by all browser vendors

Recap

I'm a bit proud. 🤫 Got the current "Java aktuell 🇩🇪" with my article about WEB-APIs (Browser not REST) 😊

I'm even on the front page. 🤫

A photograph of a running track in a stadium. The track is dark brown with white lane markings. The lanes curve to the right. The background is very foggy, obscuring the stands and the sky. In the center of the image, there is a large amount of text.

Close the gap between Web and native applications

Main goal

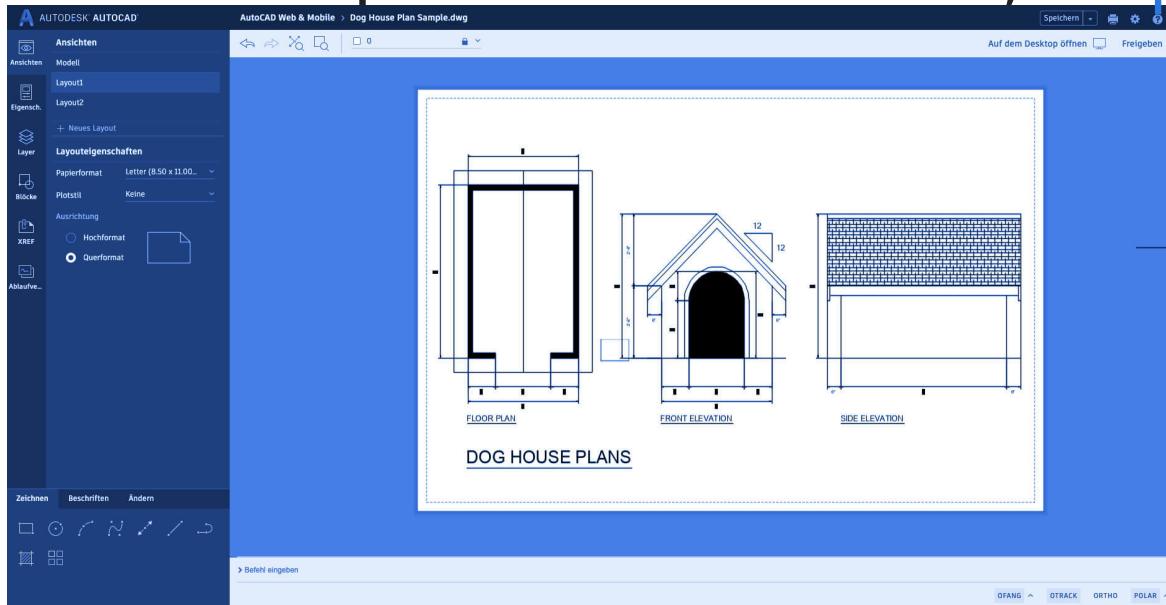

A black and white photograph showing a perspective view looking up at a bridge's support structure. The structure consists of large, dark, angled beams forming a V-shape. A horizontal beam runs across the top. In the center, there is a vertical pole with a rectangular sign attached to it. The sign has a thin border and contains the text "CHANGED SIGNALS" in a sans-serif font, centered vertically.

Guess what?
There is still a gap!

Still a gap

Great applications are already available on the Web

For example AutoCAD Web, <https://web.autodesk.com>

But, I cannot interact with DWG files from my machine 😭

Therefore application vendors use tools like [Electron](#)

Missing features

Access local files without upload

Use features of the OS

Interface access (Network, Serial)

Socializing (Share, Contacts)

and more ...

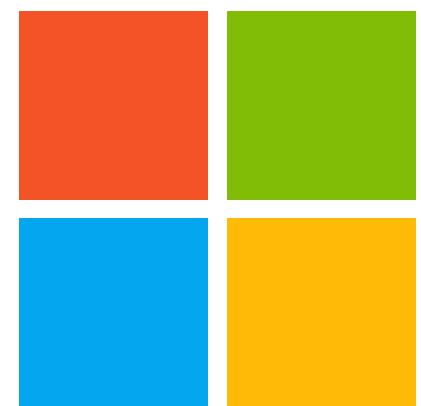

A close-up photograph of a pufferfish resting on a light-colored, textured wooden surface. The fish's body is covered in a mottled pattern of brown, tan, and white spots. Its mouth is slightly open, and its eyes are visible. The lighting highlights the scales and the overall texture of the fish's skin.

Web Capabilities Project alias Project Fugu

Project Fugu

Cross-vendor initiative

Initiated by the Google in ~2018

Fugu Community Sync notes

Chromium Issue Tracker

@giftkugel

Project Fugu

Name is derived from an asian puffer fish dish called **fugu**
Delicious if prepared correctly, deadly if not!

New capabilities

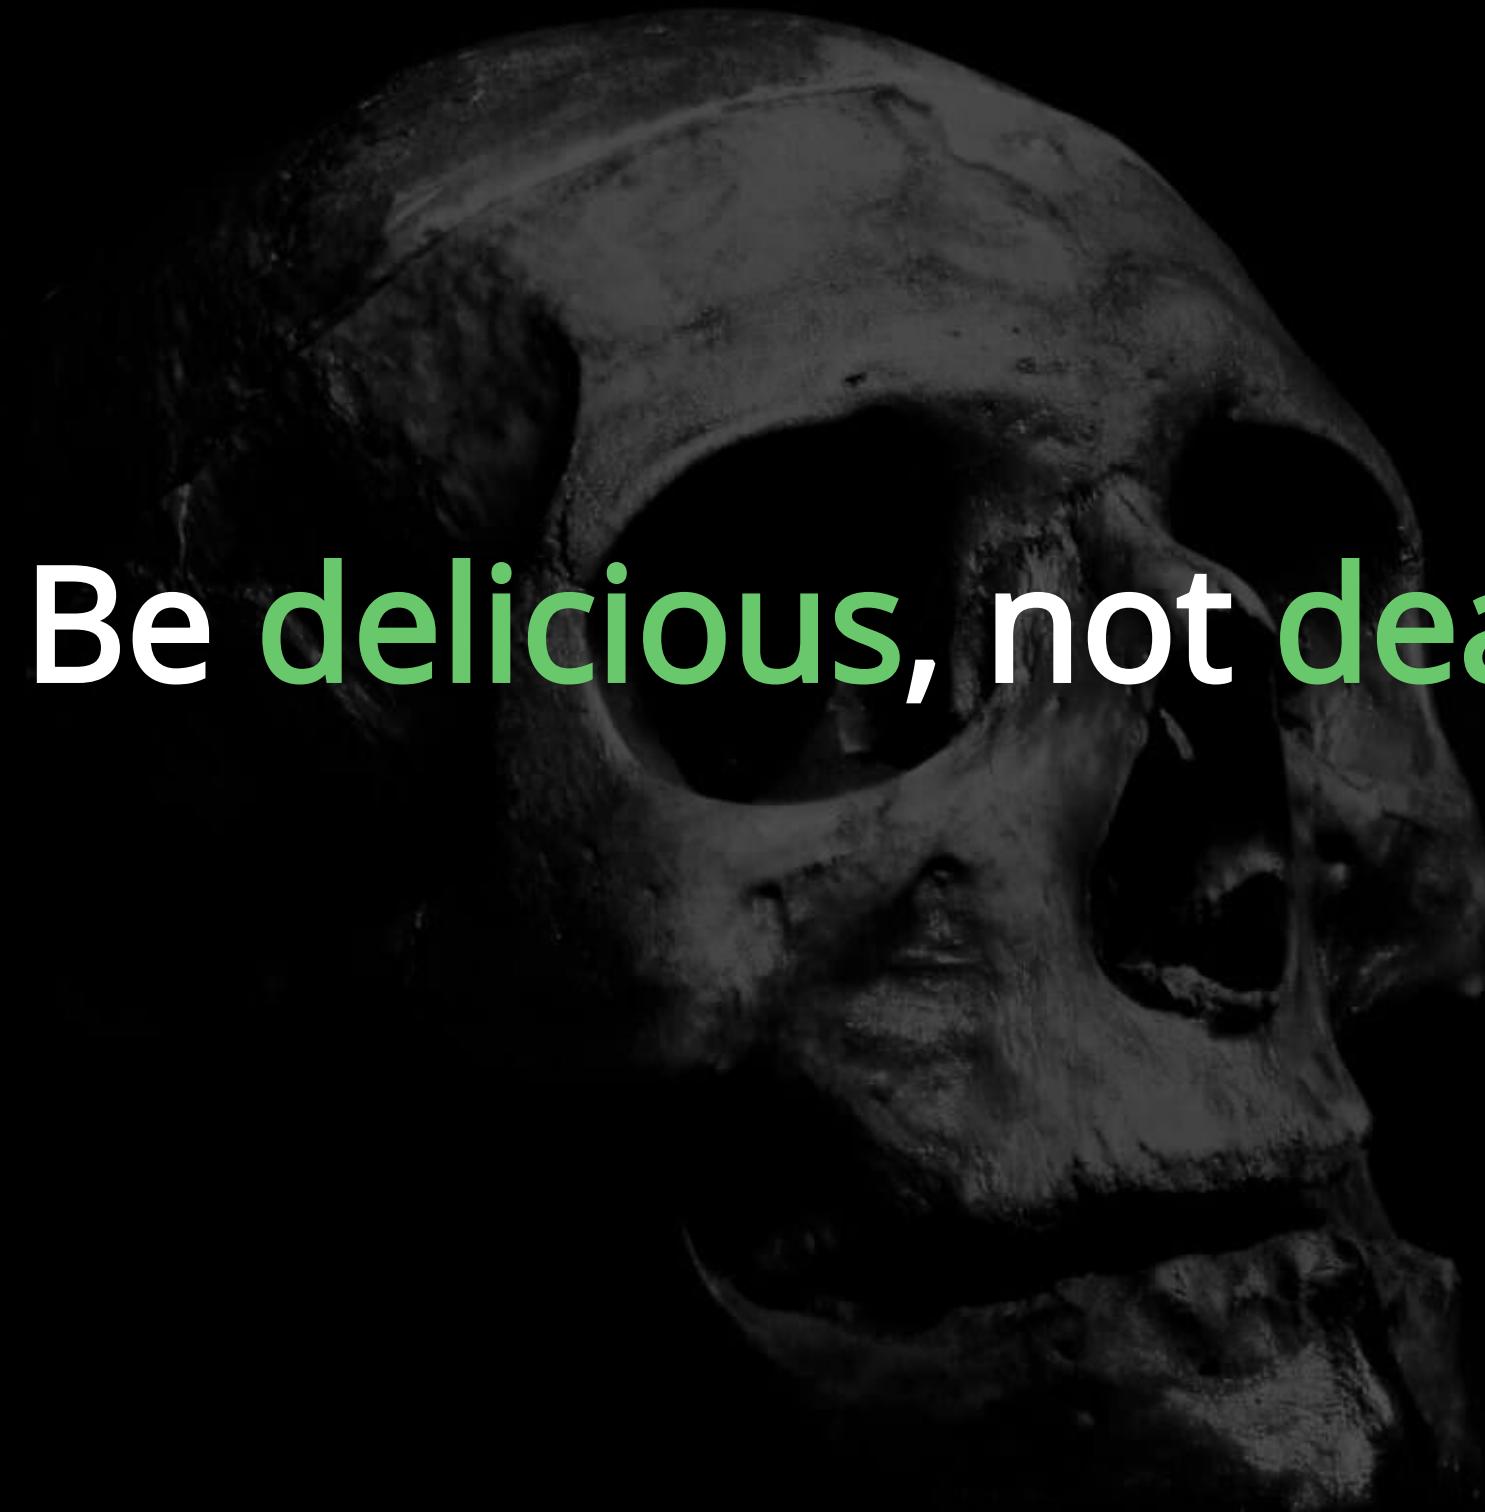

Web apps should be able to do anything iOS/Android/desktop apps can

By exposing the capabilities of these platforms to the web platform while maintaining user security, privacy, trust, and other core tenets of the web

Nothing should ever be granted access by default, but instead rely on a permission model that puts the user in total control, and is easily revoke-able. It needs to be crystal clear when, and how these APIs are being used

<https://web.dev/fugu-status/>

Be delicious, not deadly! But how?

Iterative Process

Identify need and use-cases

Write a [explainer](#)

Get feedback

Create a formal specification (first [WICG](#), and then maybe [W3C](#))

[Origin trails / Experimental flags](#)
HTTP header, HTML meta tag

Ship it

Abstraction layer

Web API

e.g. navigator.share();

Browser

Android

Windows

MacOS

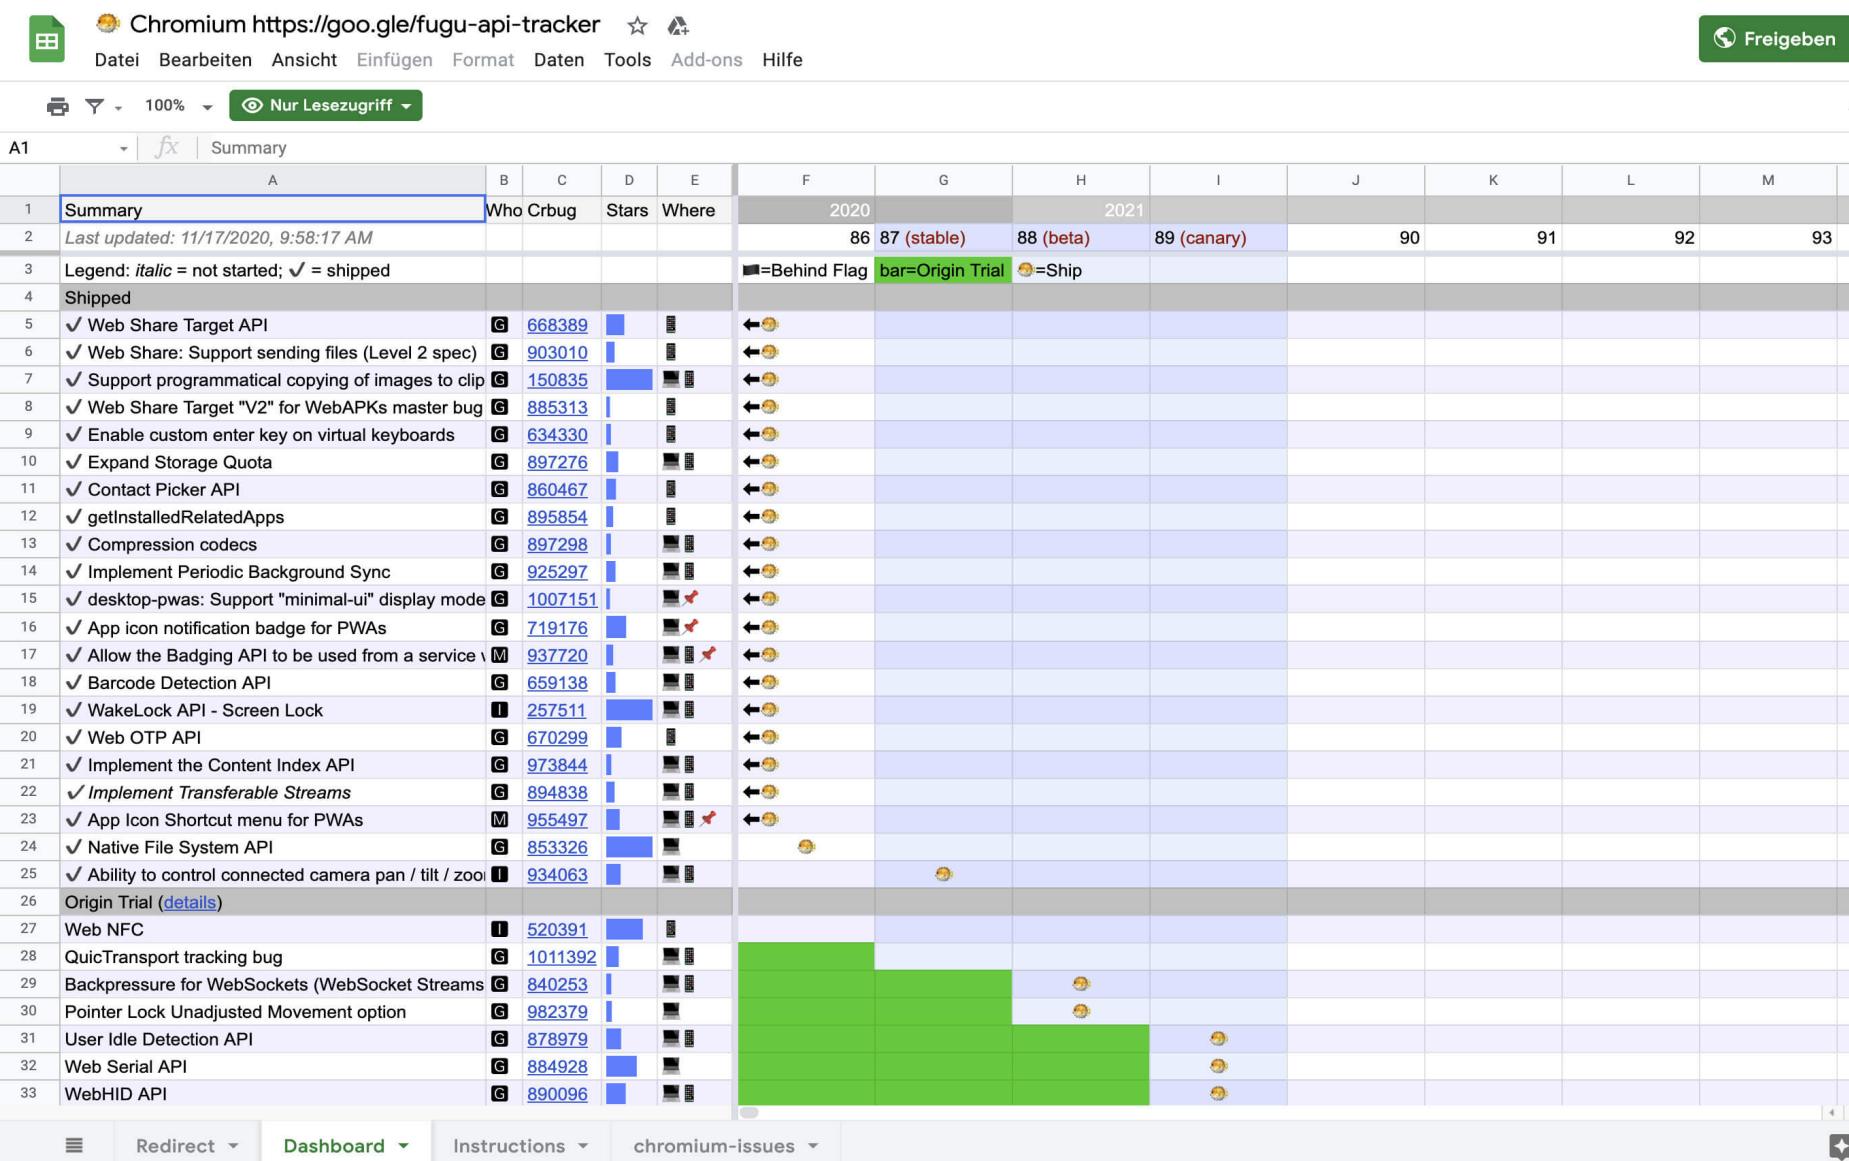

...

Which APIs will we get?

Bunch of APIs coming to town

API tracker in Google Sheets

Web Share Target	M71		+
Web Share API Level 2	M75		+
Async Clipboard: Read and Write Images	M76		+
Web Share Target Level 2	M76		+

let's take a look

Web Share API

Explainer: <https://w3c.github.io/web-share/docs/explainer.html>

Web Share is a proposed web API to enable a site to share data (text, URLs, images, etc) to an arbitrary destination of the user's choice

Web Share API Level 2 allows sharing of files

Status: **Shipped**

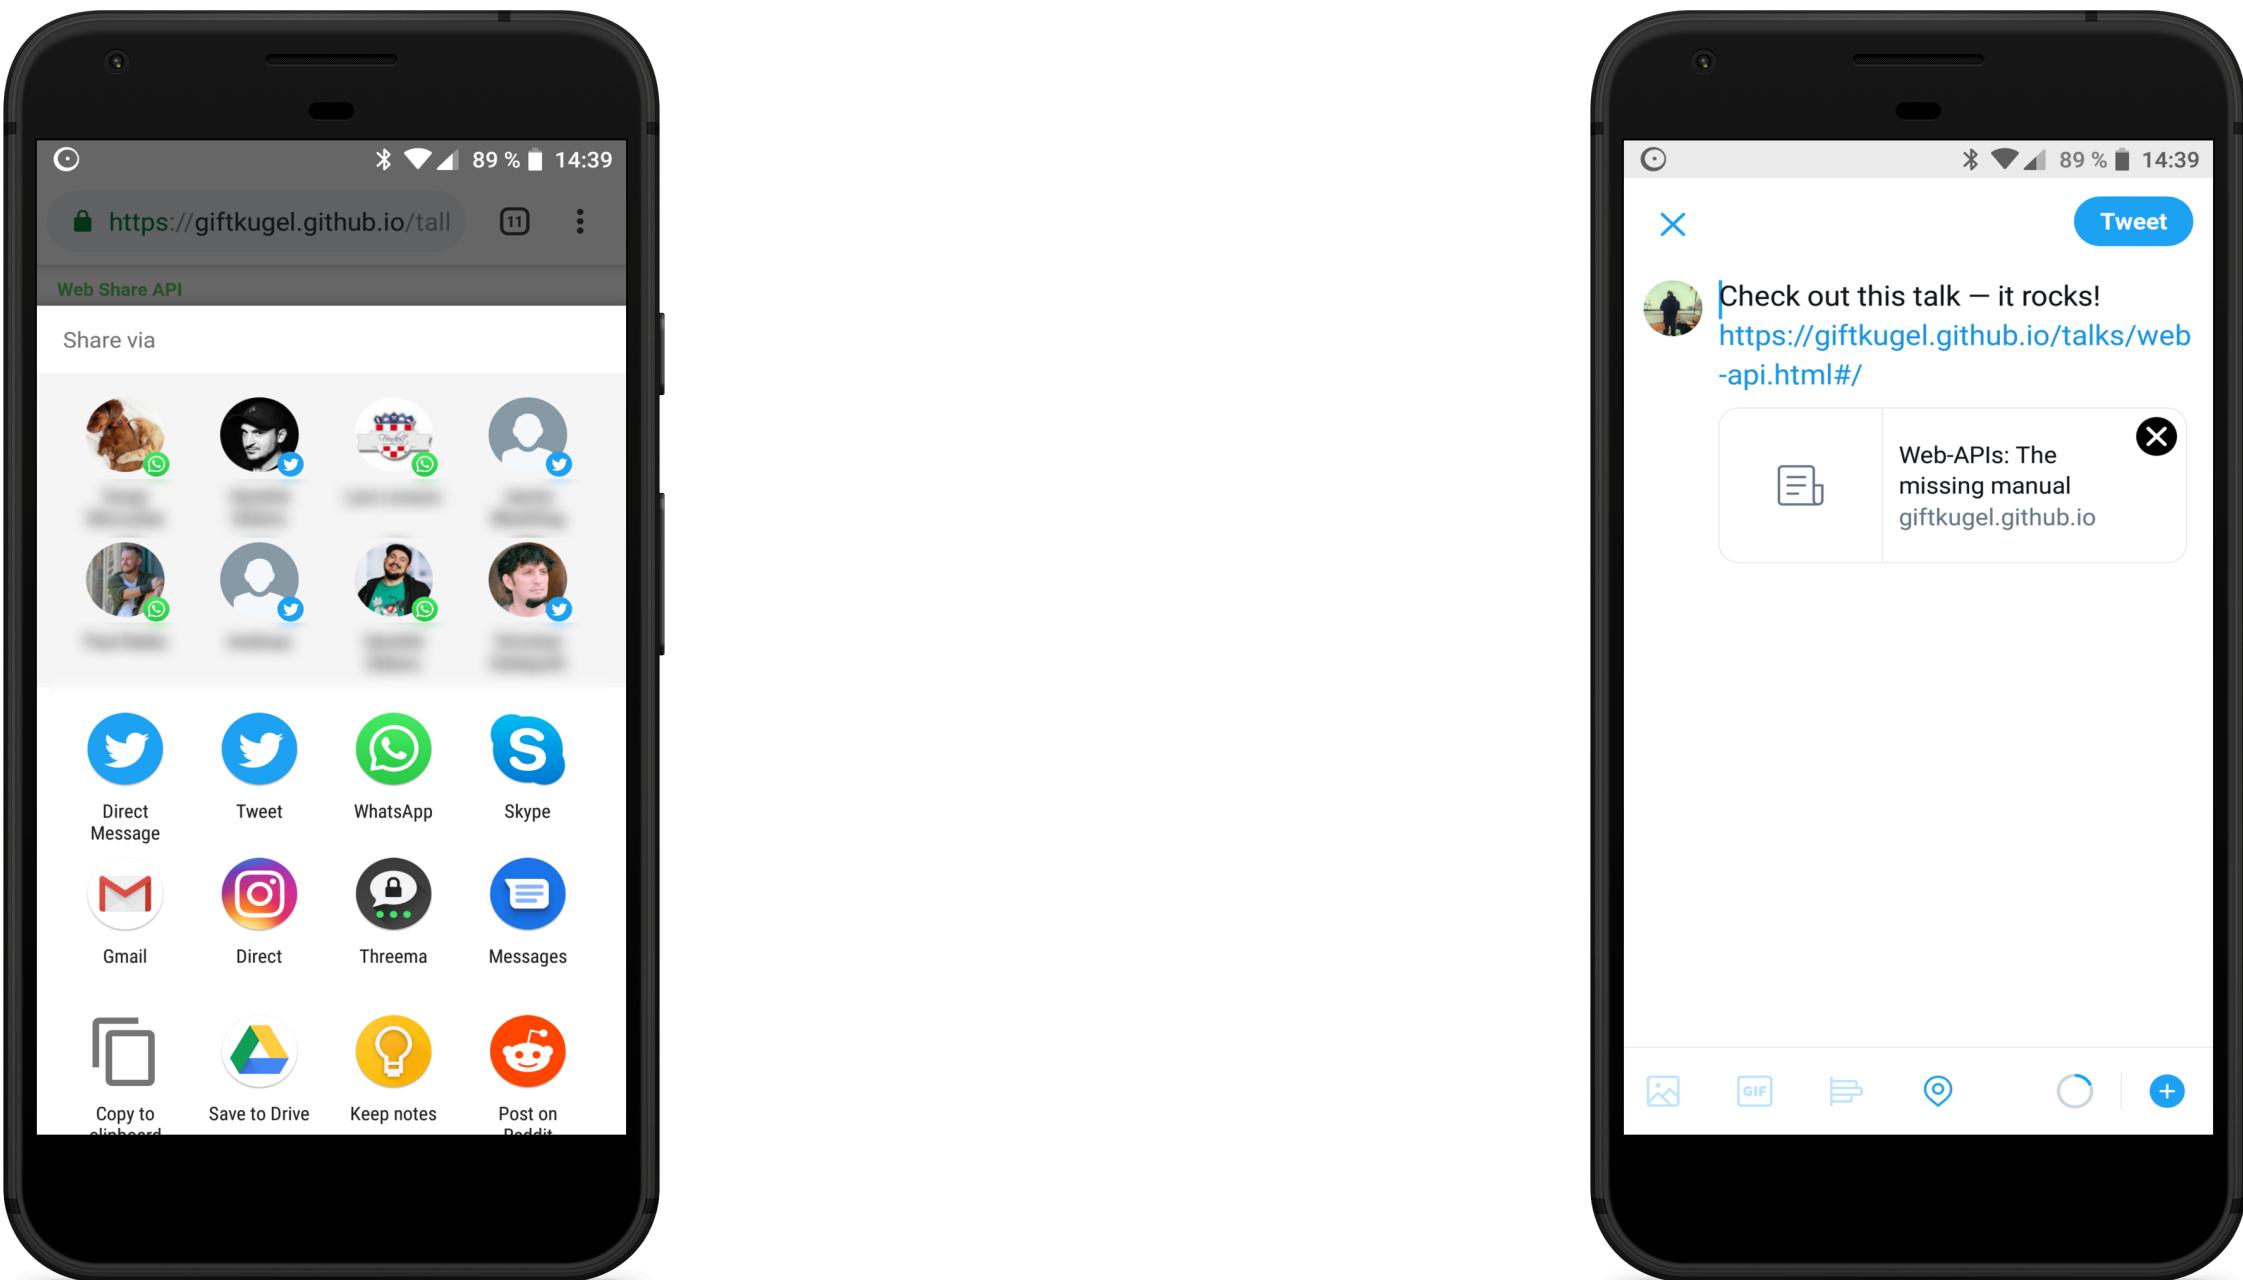

Snippet

```
shareButton.addEventListener("click", async () => {
  try {
    await navigator.share({ title: "Example Page", url: "" });
    console.log("Data was shared successfully");
  } catch (err) {
    console.error("Share failed:", err.message);
  }
});
```

Web Share API

Web Share Target API

Explainer: <https://w3c.github.io/web-share-target/docs/explainer.html>

Web Share Target is a proposed web API to enable a web site to receive shared data from other sites or apps

Status: **Shipped**

Snippet (Web manifest)

```
{  
  "name": "Example Social",  
  "short_name": "Example Social",  
  "icons": [...],  
  "share_target": {  
    "action": "share.html",  
    "method": "POST"  
    "params": {  
      "title": "name",  
      "text": "description",  
      "url": "link"  
    }  
  }  
}
```

App shortcuts

Explainer: <https://w3c.github.io/manifest/explainer.html#adding-shortcuts>

Numerous operating systems grant native applications the ability to add menu items to the app icon itself.

For web applications, you can define a set of shortcuts to be exposed when the app is installed.

Status: **Shipped**

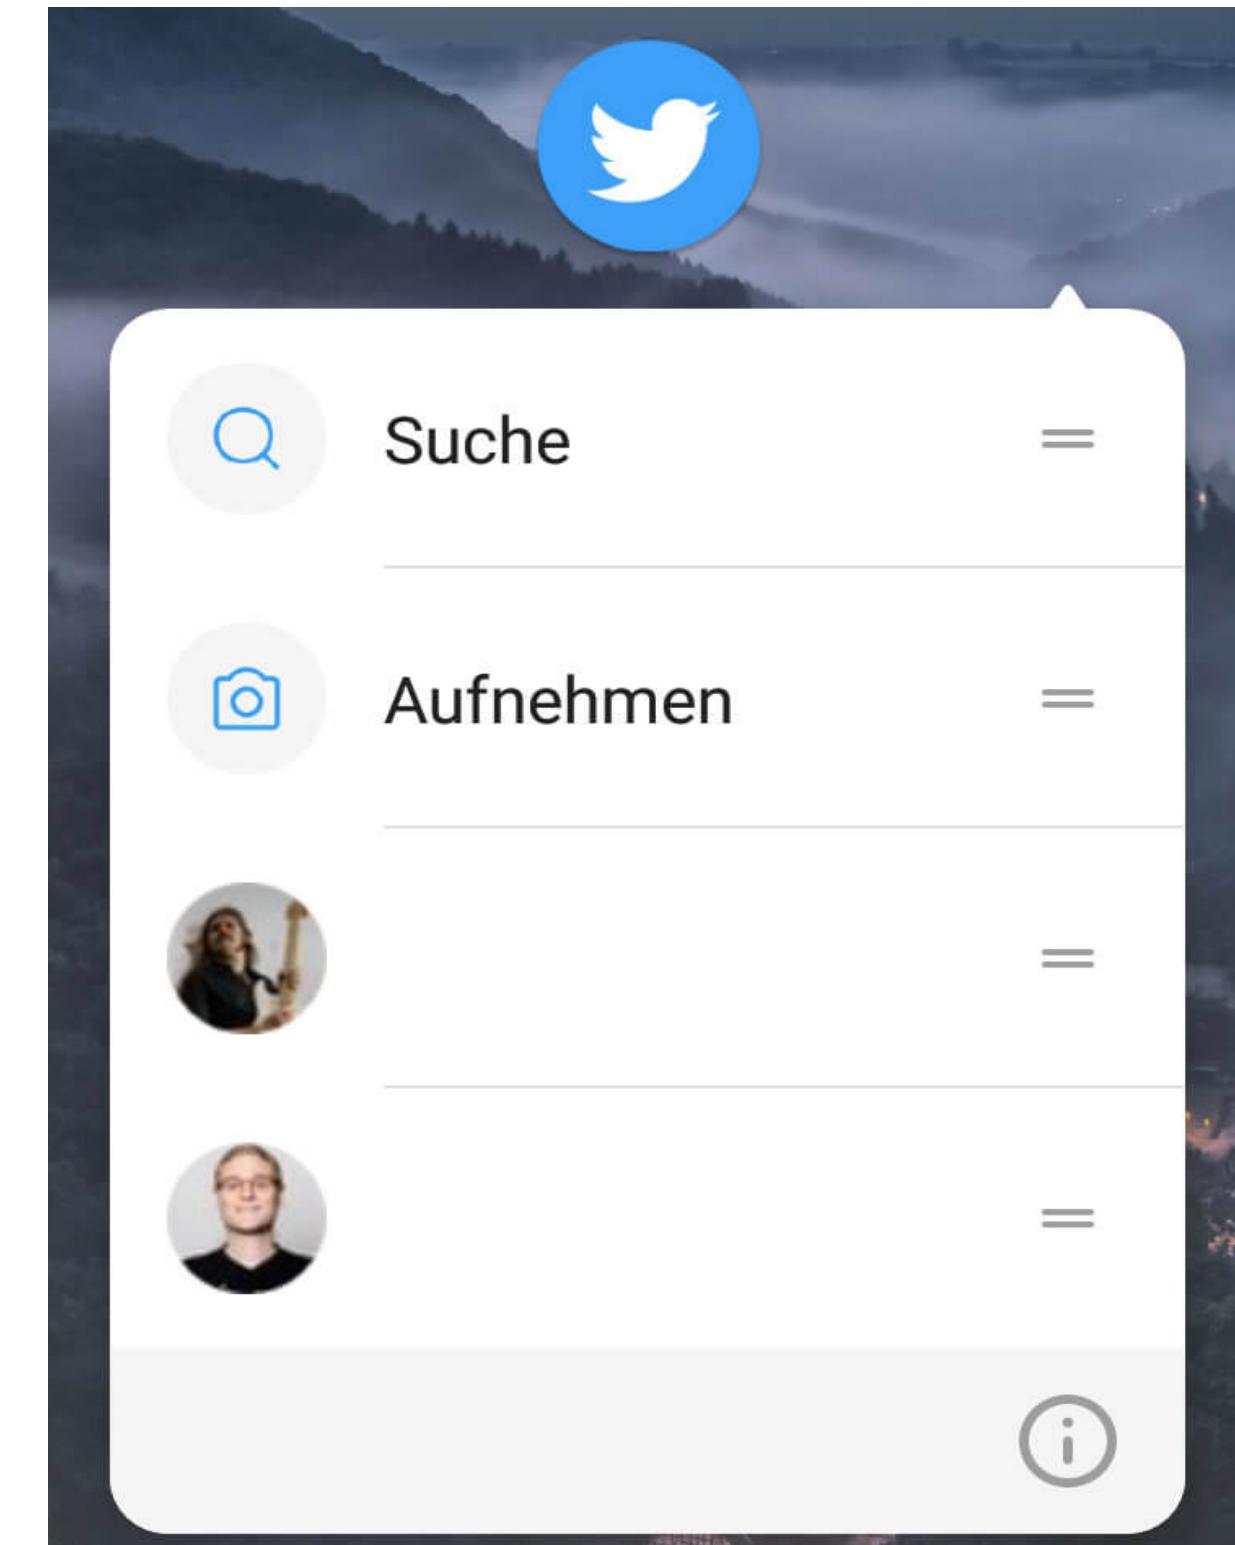

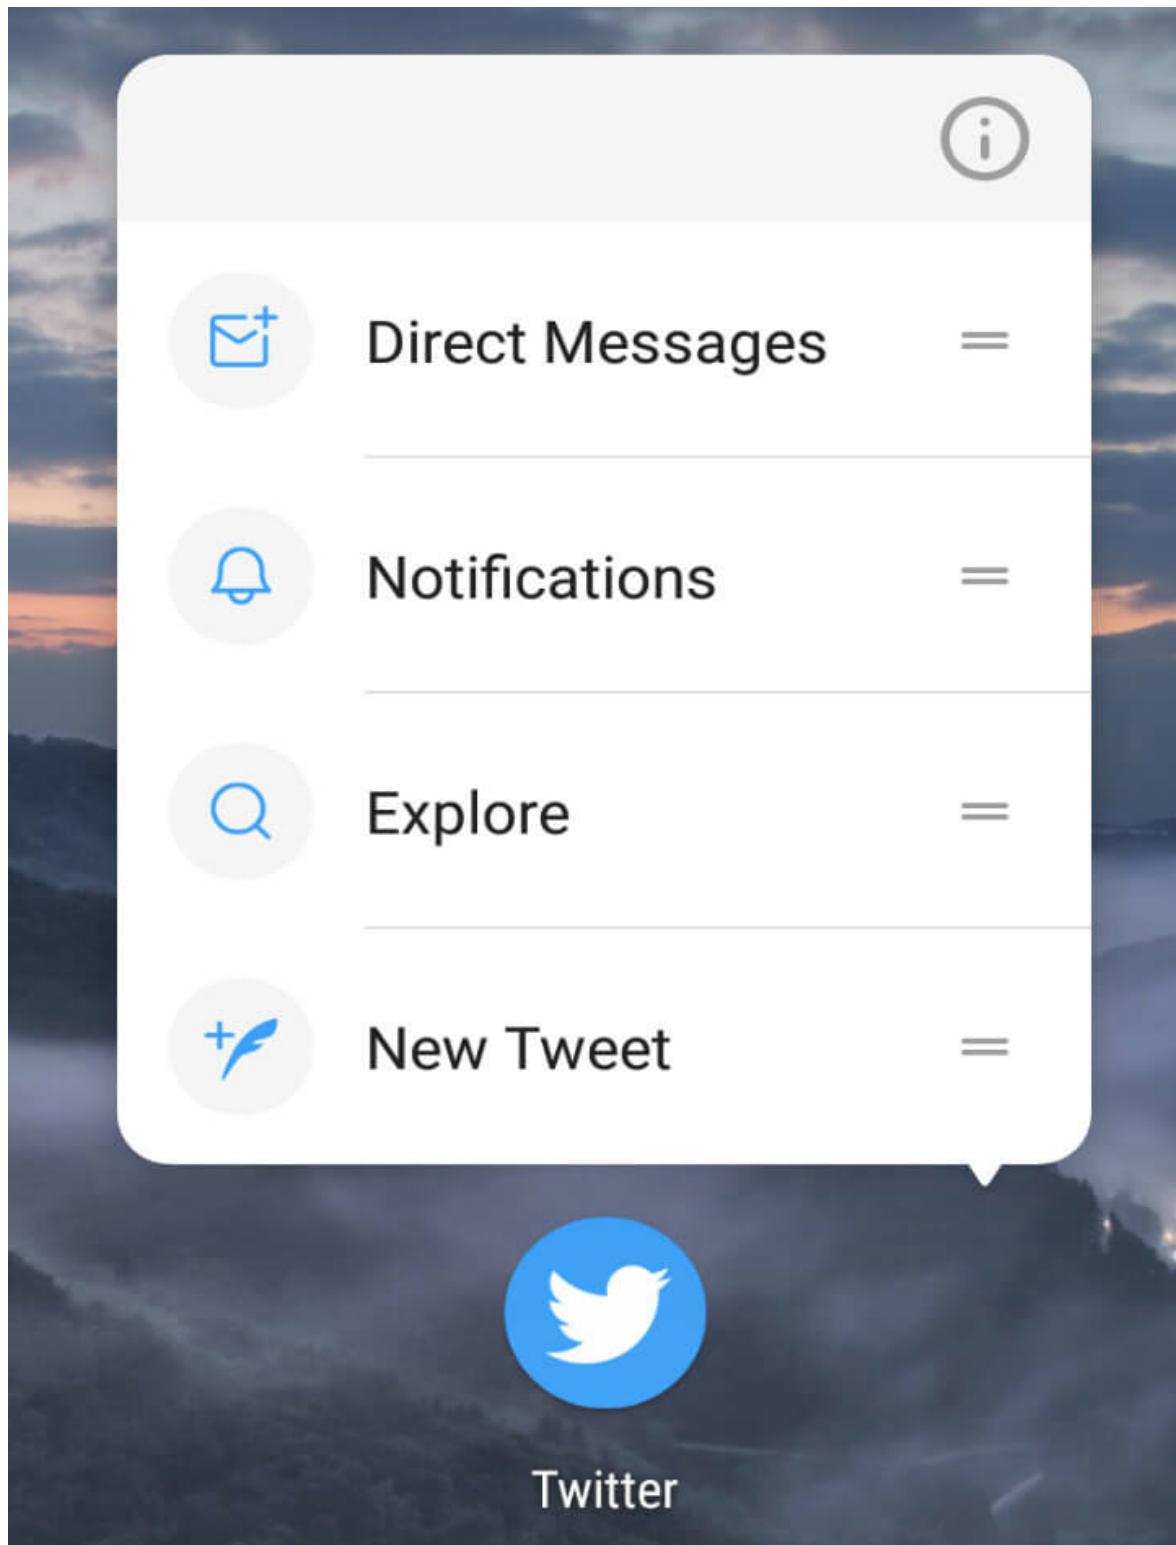

Snippet (Web manifest)

```
"shortcuts": [
{
  "name": "Play Later",
  "description": "View the list of podcasts you saved for later",
  "url": "/play-later",
  "icons": [
    {
      "src": "/icons/play-later.svg",
      "type": "image/svg+xml",
      "purpose": "any"
    }
  ]
}]
```

App shortcuts

Contact Picker API

Explainer: <https://github.com/WICG/contact-api/blob/main/README.md>

Contact information is among the most sensitive information on a device, which is why we're proposing a picker rather than a lower level API.

This enables user agents to offer an experience that's consistent with platform expectations, and to highlight the exact information that is to be shared with the website.

Status: **Shipped**

Snippet

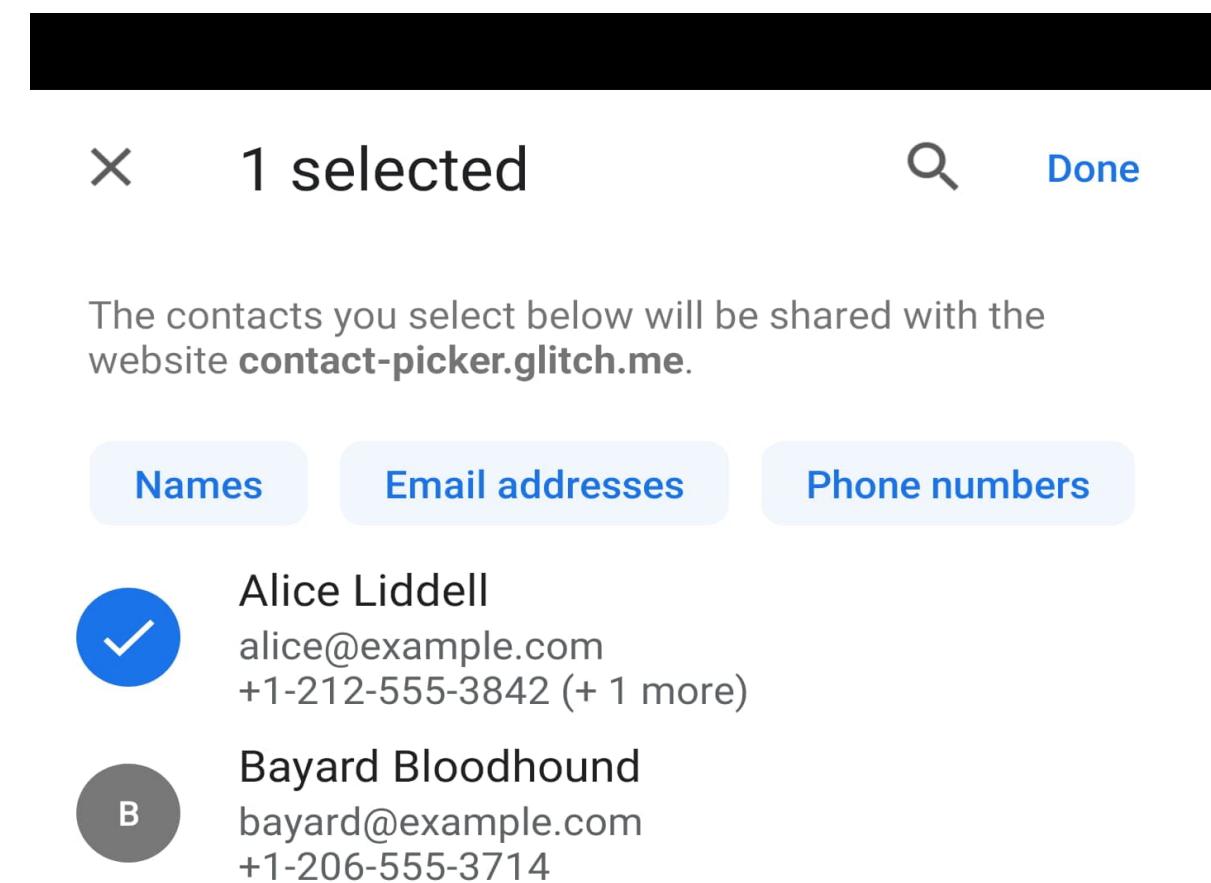

```
selectRecipientsButton.addEventListener('click', async () => {
  const contacts = await navigator.contacts.select(
    ['name', 'email', 'address', 'icon', 'tel'], { multiple: true }
  );

  if (!contacts.length) {
    // Either no contacts were selected in the picker, or the picker could
    // not be launched. Exposure of the API implies expected availability.
    return;
  }

  // Use the names and e-mail addresses in |contacts| to populate the
  // recipients field in the website's UI.
  populateRecipients(contacts);
}) ;
```

Contact Picker API

File System Access API

Explainer: <https://wicg.github.io/file-system-access/EXPLAINER.html>

This API enables developers to build powerful apps that interact with other (non-Web) apps on the user's device via the device's file system.

After a user grants a web app access, this API allows the app to read or save changes directly to files and folders on the user's device.

Status: **Shipped**

Snippet

```
const openFile = async () => {
  try {
    // Always returns an array.
    const [handle] = await window.showOpenFilePicker();
    return handle.getFile();
  } catch (err) {
    console.error(err.name, err.message);
  }
};
```

Snippet

```
const saveFile = async (blob) => {
  try {
    const handle = await window.showSaveFilePicker({
      types: [ {
        accept: {
          // Omitted
        },
      },
    },
    const writable = await handle.createWritable();
    await writable.write(blob);
    await writable.close();
    return handle;
  } catch (err) {
    console.error(err.name, err.message);
  }
};
```

Idle Detection API

Explainer: <https://wicg.github.io/idle-detection/HOWTO.html>

This proposed API allows developers to add an event listener for when the user becomes idle (e.g. they don't interact with the keyboard, mouse or touchscreen, when a screensaver activates or when the screen is locked).

Unlike solutions based on monitoring input events this capability extends beyond the site's content area (e.g. when users move to a different window or tab).

Status: Origin Trail

Snippet

```
const idleDetector = new IdleDetector();
idleDetector.addEventListener('change', () => {
  console.log(`Idle change: ${idleDetector.userState}, ${idleDetector.screenState}.`);
});
await idleDetector.start({
  threshold: 60000,
  signal,
});
```

Notification Triggers API

Explainer: <https://github.com/beverloo/notification-triggers/blob/master/README.md>

Notification Triggers are a mechanism for preparing notifications that are to be shown when certain conditions are met.

The trigger could be time-based, location-based or otherwise—for this explainer, we'll focus on time-based triggers.

Status: Origin Trail

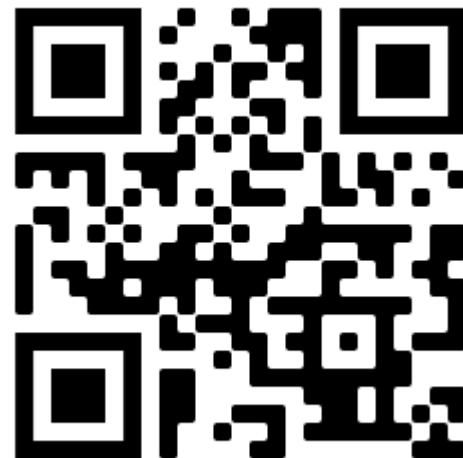

Notification Triggers API

Snippet

```
const createScheduledNotification = async (tag, title, timestamp) => {
  const registration = await navigator.serviceWorker.getRegistration();
  registration.showNotification(title, {
    tag: tag,
    body: 'This notification was scheduled 30 seconds ago',
    showTrigger: new TimestampTrigger(timestamp + 30 * 1000),
  });
};
```

Try it yourself (Shipped features)
